Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SUMMARIES

The present invention relates to a novel monoclonal antibody (I) that specifically binds to a mammalian IgE epitope, where the epitope is between amino acids 145-166 or 356-374 of mammalian IgE, e.g. dog IgE. (I) is useful for testing an allergen reactivity of an IgE sample. The allergen is chosen from mold, pollen, dust mite, milk, egg, soy peanut and corn allergens. The sample is a biological sample collected from a dog, cat or horse. (I) is also useful for detecting mammalian IgE and for treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal antibodies recognise epitopes on canine IgE corresponding to amino acid residues 357-371 (ADR10601) and 146-162 (ADR10609) respectively of the

Novel antibody that specifically binds to mammalian IgE epitope, useful for testing an allergen reactivity of IgE sample, detecting mammalian IgE or treating asthma or anaphylactic shock.

The invention relates to an immunogenic composition comprising an CC isolated polypeptide having an amino acid sequence that is at least 80% CC identical to 6 (S1-S6), 15 amino acid peptide sequences derived from CC equine immunoglobulin E (the composition induces production of an CC antibody that specifically binds to equine immunoglobulin (Ig)E), the six CC polypeptides are not explicitly identified in the specifically binds (CC polypeptide at least 80% identified in the specifically binds (CC to a polypeptide at least 80% identical to (S1)-(S6), an antibody that specifically binds (CC particularly binds to equine IgE made by the process of immunising an CC animal with a polypeptide at least 80% identical to (S1)-(S6), making an CC animal with a composition further comprising an isolated polypeptide (the antibody that specifically binds to equine IgE (involving immunising an CC animal with a composition further comprising an isolated polypeptide (the CC amino acid sequence of the polypeptide is at least 80% identical to (S1)-(S6)), and collecting antiserum from the animal) and a kit for detection (G equine IgE in a biological sample comprising the antibody and means (CC antibody is useful for detecting equine IgE protein in a biological (CC sample (serum) which involves contacting the sample with the antibody, thus forming an antigen/antibody complex. The antibody and antigen are imposition of the antibody complex and detecting the presence or imposition of the antigen/antibody complex. The antibody and antigen are incompleted to the antibody and antigen are the imposition of the antibody complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 canine IgE epsilon-chain. Recognition of epsilon-chains from IgE from cat, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and 3.76 were observed to have good cross-reactivity with the epsilon-chain of IgE from cat and horse, but did not exhibit cross-reactivity with either pig or human epsilon-chains of IgE. The present sequence is the horse IgE 5.91 recognition site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immunogenic composition comprising an isolated equine immunoglobulin E polypeptide that induces production of antibodies which specifically bind to equine immunoglobulin E.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 1; Page 8; 14pp; English.

                                                                              specifically binds to a mammalian IgE epitope, where the epitope is between amino acids 145-166 or 356-374 of mammalian IgE, e.g. dog IgE. (I) is useful for testing an allergen reactivity of an IgE sample. The allergen is chosen from mold, pollen, dust mite, milk, egg, soy, peanut and corn allergens. The sample is a biological sample collected from a dog, cat or horse. (I) is also useful for detecting mammalian IgE and for reating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal antibodies recognise epitopes on canine IgE corresponding to amino acid residues 357-371 (ADR10601) and 146-162 (ADR10609) respectively of the canine IgE epsilon-chain. Recognition of epsilon-chains from IgE from cat, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and cat, horse, pig and human by 5.91 and 3.76 was examined.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     complex can be detected. The complex is detected using a second labelled antibody. The peptides are useful for generating antibodies specific for IgE which can serve as a diagnostic test for allergy. The present sequence is a Horse immunoglobulin E, IgE, heavy chain immunogenic peptide from the early portion of the C4 region.
                               of IgE from cat and either pig or human
                                                                                                                                                                                                                                                                                                                                                         Novel antibody that specifically binds to for testing an allergen reactivity of IgE or treating asthma or anaphylactic shock.
                                                                                                                                                                                                                                                                                     The present invention relates to a novel monoclonal antibody (I) that
                                                                                                                                                                                                                                                                                                                       Example 6; Page 9; 14pp; English.

                                                                                                        Ś
                                                                                                                                                                                                                g
                                                                                                                                                                                                                                        The present invention relates to a novel monoclonal antibody (I) that gpecifically binds to a mammalian IgE epitope, where the epitope is between amino acids 145-166 or 356-374 of mammalian IgE, e.g. dog IgE. (I) is useful for testing an allergen reactivity of an IgE sample. The CC allergen is chosen from mold, pollen, dust mite, milk, egg, soy, peanut can dorn allergens. The sample is a biological sample collected from a CC dog, cat or horse. (I) is also useful for detecting mammalian IgE and for treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal cantibodies recognise epitopes on canine IgE corresponding to amino acid cresidues 357-371 (ADR10601) and 146-162 (ADR10609) respectively of the CC canine IgE epsilon-chain. Recognition of epsilon-chains from IgE from CC cat, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and CC 3.76 were observed to have good cross-reactivity with the epsilon-chain cat and horse, but did not exhibit cross-reactivity with the cither pig or human epsilon-chains of IgE. The present sequence is the CC pig IgE 5.91 recognition site.
                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                             á
                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a novel monoclonal antibody (I) that specifically binds to a mammalian IgE epitope, where the epitope is CC between amino acids 145-166 or 356-374 of mammalian IgE, e.g. dog IgE. CC (I) is useful for testing an allergen reactivity of an IgE sample. The CC allergen is chosen from mold, pollen, dust mite, milk, egg, soy, peanut CC and corn allergens. The sample is a bidogical sample collected from a CC dog, cat or horse. (I) is also useful for detecting mammalian IgE and for treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal CC residues 357-371 (ADR10601) and 146-162 (ADR10609) respectively of the CC canine IgE epsilon-chain. Recognition of epsilon-chains from IgE from CC cat, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and CC of IgE from cat and horse, but did not exhibit cross-reactivity with the epsilon-chain CC cat IgE from cat and horse, but did not exhibit cross-reactivity with CC cat IgE 5.91 recognition site.

The modified enzyme can result in CPG2 proteins that are substantially non-immunogenic or less immunogenic than any non-modified CPG2 having essentially the same biological specificity when used in vivo, and comprising specific amino acid residues having alterations compared with the non-modified parochial enzyme. The alterations cause a reduction or an elimination of one or more of T-cell epitope sequences, which act in the parental enzyme as MHC class II binding ligands and stimulate T-cells. The modified CPG2 enzyme and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                29-NOV-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CPG2 proteins have immunostimulant activity and may be used in enzyme therapy. The modified CPG2 enzyme may be used to induce an immune response in a human host, or as a therapeutic entity such as the gene directed enzyme prodrug strategy. The peptide is useful for the manufacture of a modified CPG2 enzyme having substantially no or less immunogenicity than any non-modified parental enzyme when used in vivo, and for vaccination of patients to reduce immunogenicity to CPG2 in vivo.

This sequence represents a CPG2 enzyme peptide able to stimulate human T-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC Carboxypeptidase G2 (CPG2). The modified enzyme can result in CPG2
CC proteins that are substantially non-immunogenic or less immunogenic than
CC any non-modified CPG2 having essentially the same biological specificity
CC when used in vivo, and comprising specific amino acid residues having
CC alterations compared with the non-modified parochial enzyme. The
CC alterations cause a reduction or an elimination of one or more of T-cell
CC pitope sequences, which act in the parental enzyme as MHC class II
CC binding ligands and stimulate T-cells. The modified CPG2 enzyme and the
CC CPG2 proteins have immunostimulant activity and may be used in enzyme
CC therapy. The modified CPG2 enzyme may be used to induce an immune
CC tresponse in a human host, or as a therapeutic entity such as the gene
CC directed enzyme prodrug strategy. The peptide is useful for the
CC manufacture of a modified CPG2 enzyme having substantially no or less
CC immunogenicity than any non-modified parental enzyme when used in vivo,
CC and for vaccination of patients to reduce immunogenicity to CPG2 in vivo.
CC This sequence represents an immunogenic peptide of the CPG2 enzyme of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a composition (I) comprising purified polypeptides from bacteria. Also described: (1) a crystallized, recombinant polypeptide comprising an amino acid sequence of (I), where the polypeptide is in crystal form; (2) a crystallized complex comprising the crystallized, recombinant polypeptide and a co-factor or a small organic molecule, where the complex is in crystal form; and (3) a host cell comprising a nucleic acid encoding a polypeptide of (I), where a culture of the host cell produces at least about 1 mg of the polypeptide per liter of culture and the polypeptide is at least about one-third soluble as measured by gel electrophoresis. The composition and methods are useful for diagnosing, preventing or treating diseases, such as microbial infections. These may also be used in pharmacogenomic or drug screening procedures. The present sequence expresents a Pseudomonas are appreciated which is used in monay and accomplex composition and methods are presented as the composition and methods are useful for diagnosing, preventing or treating diseases, such as microbial infections. These may also be used in pharmacogenomic or drug screening procedures. The present sequence expresents a Pseudomonas

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for predicting the biological CC activity of new receptor modulating compounds (I) using novel oligomeric CC peptides (biokeys) which have differential abilities to bind to 2 conditions. The method is used to identify new CC drugs that are physiological or pharmacological agonists/antagonists and CC that target various receptors, which are involved in certain disease CC conditions. The system may be used as a primary screening tool to CC identify hits, to classify lead compounds from a drug screen to, CC characterise selective oestrogen receptor modulators (SERMs) in terms of CC agonist and antagonist function and to predict possible clinical effects of SERMs such as tissue and receptor specificity. The method can also be capplied to the fractionation of mixtures of SERMs to determine which CC applied to the fractionation of mixtures of SERMs to determine which CC applied to the fractionity of the prospector, to identify, characterise and classify CC epidermal growth factor, to identify, characterise and classify CC epidermal growth factor, to identify, characterise and classify CC used to modulators of receptor activity. Peptides comprising a LXXLL motif may be contained and ameliorating the effects of menopause, including contention and oestrogen receptor in treating e.g. breast and costeoporosis. AAY65439 to AAY65652 represent oestrogens receptor, cestradiol receptor and oestrogen response element binding peptides given in the exemplification of the present invention. AAZ35740 to AAZ35745
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

Identifying receptor-binding peptides comprises screening combinatorial peptide library presented in form of cells each of which coexpress one peptide member and receptor with signal producing system for reporting
```

Disclosure; Page 146; 175pp; English

Comprising screening a combinatorial library of peptides, comprising screening a combinatorial peptide library presented in the compress the receptor or its ligand-binding receptor comoiety and one member of the library, together with a signal producing system for reporting binding of the peptide to the receptor. Also compound which modulates the biological activity of a receptor activity of a compound by (i) product the receptor by the method above, (b) consider the members differ in their ability to bind the receptor. Move the receptor by the method above, (c) in identifying peptides which bind the receptor is in, where the field peptides, compound by (i) providing a panel of identified peptides, compound by (i) providing a panel of identified peptides, compound by (i) providing a panel of identified peptides, coff a number of treference substances known to modulate the biological activity of a compound by (i) providing a panel of identified peptides, coff a number of treference substances known to modulate the biological activity of the receptor on the binding of each member of the panel is comparised as a reference fingerprint for each reference coffice the panel to the receptor, thereby obtaining a test finderprint for the test substance, (ii) screening a test substance of unknown activity relative the panel to the receptor, thereby obtaining a test finderprint for the test substance and (iv) predicting the biological activity of the test compound (e.g. and (iv) predicting the biological activity of the test substance with similar finderprint. The members are useful for identifying a binding peptide which binds a cutivity of a compound (e.g. antiogen) receptor. The identified peptides which binds to the receptor activity of a compound (e.g. antiogen) receptor. The identified peptides which is different conceptors, the superior can be applied to a variety of small organic method has several advantages over whole animal-based assay systems in that the same technology can be applied to a variety of different Sequence 15 AA; The invention relates to identifying a binding peptide which binds a receptor and which is a member of a combinatorial library of peptides

The method is useful in identifying drugs which can mediate the biological activity of a target protein. The receptor-binding library members may be used as therapeutic or diagnostic reagents, for in vivo imaging, or to purify target from a fluid, e.g. blood. The present sequence represents an oestrogen receptor beta binding peptide.

                                                                                                                                                            Novel antibody that specifically binds to mammalian IgE epitope, usefu for testing an allergen reactivity of IgE sample, detecting mammalian or treating asthma or anaphylactic shock.
                                                                                                                                                                     IgE
```

Page 9; 14pp; English.

specifically binds to a mammalian IgE epitope, where the epitope is between amino acids 145-166 or 356-374 of mammalian IgE, e.g. dog IgE. (I) is useful for testing an allergen reactivity of an IgE sample. The allergen is chosen from mold, pollen, dust mite, milk, egg, soy, peanut and corn allergens. The sample is a biological sample collected from a dog, cat or horse. (I) is also useful for detecting mammalian IgE and for treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal antibodies recognise epitopes on canine IgE corresponding to amino acid residues 357-371 (ADR10601) and 146-162 (ADR10609) respectively of the canine IgE epsilon-chain. Recognition of epsilon-chains from IgE from cat, horse, pig and human by 5.91 and 3.76 were observed to have good cross-reactivity with the epsilon-chain of IgE from cat and horse, but did not exhibit cross-reactivity with either pig or human epsilon-chains of IgE. The present sequence is the Sequence 15 AA; The present invention relates to a novel monoclonal antibody (I) IgE 5.91 recognition site.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC The invention relates to a new polynucleotide comprising a multi-epitope CC construct comprising nucleic acids encoding the human papillomavirus CC (HPV) cytotoxic Tlymphocyte (CTL) epitopes e.g., HPV16.E1.214, and that CC are directly or indirectly joined to one another in the same reading CC frame, a vaccine minigene. Also included are a vector comprising the CC multi-epitope construct, a polypeptide comprising an amino acid sequence cc encoded by the polynucleotide, a composition (comprising the polynucleotide, vector or polypeptide and a carrier), a cell CC polynucleotide, vector polypeptide and a carrier), a cell CC immune response against human papillomavirus virus (HPV) and making the polynucleotide, vector or polypeptide), inducing an CC different strains of HPV and are from the El, E2, E6 and E7 proteins. The epitopes may be linked via a GP-anchor/spacer peptide. The order of the cpitopes may be linked via a GP-anchor/spacer peptide. The order of the cpitopes in the vaccine protein are disclosed in the tables referred to cin the claims of the specification. The polynucleotide, vector or cpolypeptide is useful in preparing a composition for inducing an immune CC defense against HPV infection and HPV-related cancers. The present contents of the sequence is an HPV-derived peptide epitope that binds to a subclass of the human leukocyte antigen (HLA) peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                        CC construct comprising nucleic acids encoding the human papillomavirus (HPV) cytotoxic Tlymphocyte (CTL) epitopes e.g., HPV16.El 214, and that CC are directly or indirectly joined to one another in the same reading CC frame, a vaccine minigene. Also included are a vector comprising the CC multi-epitope construct, a polypeptide comprising an amino acid sequence CC encoded by the polynucleotide, a composition (comprising the polynucleotide, vector or polypeptide and a carrier), a cell CC (comprising the polynucleotide, vector or polypeptide and a carrier) a cell CC (immune response against human papillomavirus virus (HPV) and making the CC polynucleotide, vector or polypeptide. The epitopes are derived from CC different strains of HPV and are from the El, E2, E6 and E7 proteins. The CC epitopes may be linked via a GP-anchor/spacer peptide. The order of the CC epitopes in the vaccine protein are disclosed in the tables referred to CC polypeptide is useful in preparing a composition for inducing an immune CC response against HPV infection and HPV-related cancers. The present CC sequence is an HPV-derived peptide epitope that binds to a subclass of CC human leukocyte antigen (HLA) peptides.

                                                                                                                                                                                                                                                    The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                  A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug candidates or pro-drugs.
